

## TECHNICAL E-LEARNING

### In brief

E-learning courses useful for making any technical subject clear, pleasant and engaging (procedures, regulations, products, post-sales), adapting language and tools to specific technological cultures and environments, reducing the complexity of information in favour of simplicity and the company's knowledge management.

### What is it?

Technical training is very important in a company; comprehensive but unusable manuals, detailed but unreadable procedures, and instruction manuals are often hard to understand and represent a problem for many companies. Good technical training reduces the complexity of information in favour of clarity and synthesis of knowledge management.

### What is it for?

- transforming complex manuals, procedures, regulations, catalogues, and implicit, unshared knowledge into synthetic, clear, hypertextual, engaging courses
- systematise and capitalise on the patrimony of the company's knowledge (including that which hasn't been encoded) through a shared language
- making communication easy, quick and clear
- regulating procedural standards of large targets that are dispersed across the territory
